Introduction

This document is intended to give an in-depth look at the various output files produced by EnergyPlus. Some of these may be referenced in various other parts of the documentation but are presented here with more details.

The scripts that assist in running EnergyPlus will usually rename the standard names used in the program. The two scripts that are distributed with EnergyPlus are: **EPL-Run.bat** (which is used by the EP-Launch program) and **RunEPlus.bat** (which can be used from the command line). The RunEPlus batch file can also be used to string together several runs such as usually termed “batch processing”. In renaming the files created by the program or its post-processing program(s), usually the file extension will be retained. The following table will illustrate the native EnergyPlus file name, a description of its contents and the EP-Launch “version” of the file. In this table, <filename> refers to the source/original file name (without extension) selected. Files are presented in alphabetic order. For output purposes, the most important files to understand are the eplusout.eso, eplusout.mtr and eplusout.err files. The first two are manipulated with the ReadVarsESO post processing program. The latter will contain any critical errors that were encountered during the run.

Output File List

Table 1. EnergyPlus Basic Output Files

Output File Name	Description	EP-Launch File Name
Audit.out	Echo of input, includes both IDD echo and IDF echo – may have errors shown in context with IDD or IDF statements	Not saved in the standard EPL-Run scriptfile.
eplusout.bnd	This file contains details about the nodes and branches. Useful in determining if all your nodes are connected correctly. May be used to diagram the network/ nodes of the HVAC system.	<filename>.bnd
eplusout.cif	This file is a by-product of using COMIS airflow. It contains the first commands sent during the EnergyPlus simulation and can be used with a stand-alone COMIS program.	<filename>.cif
eplusout.dbg	From Debug Output object – may be useful to support to help track down problems	<filename>.dbg
eplusout.dxf	DXF (from Report,Surfaces,DXF;)	<filename>.dxf
eplusout.eio	Contains several standard and optional “report” elements. CSV format – may be read directly into spreadsheet program for better formatting.	<filename>.eio
eplusout.end	A one line summary of success or failure (useful for Interface programs)	Not saved in the standard EPL-Run script file.
eplusout.err	Error file – contains very important information from running the program.	<filename>.err
eplusout.eso	Standard Output File (contains results from both Report Variable and Report Meter objects).	<filename>.eso
eplusout.mtd	Meter details report – what variables are on what meters and vice versa.	<filename>.mtd

eplusout.mtr	Similar to .eso but only has Report Meter outputs.	<filename>.mtr
eplusout.rdd	Report Variable names that are applicable to the current simulation.	<filename>.rdd
eplusout.sln	Similar to DXF output but less structured. Results of Report Surface, Lines object.	<filename>.sln
eplusout.ssz	Results from the System Sizing object. This file is "spreadsheet" ready.	<filename>.ssz
eplusout.trn	This file is a by-product of using the Photovoltaics-TRNSYS link. It contains the "listing" from executing TRNSYS. If multiple run periods are included in the EnergyPlus simulation, this file will contain results from multiple TRNSYS executions.	<filename>.trn
eplusout.zsz	Results from the Zone Sizing object. This file is "spreadsheet" ready.	<filename>.zsz

In addition to the basic output files from EnergyPlus there are two standard "hybrid" output files. These are called "hybrid" because they are a result of post-processing after EnergyPlus has completed. Note that if there is an error during processing, these will not normally be "complete".

Table 2. "Hybrid" EnergyPlus Output Files

Output File Name	Description	EP-Launch File Name
eplusout.csv	CSV "spreadsheet" ready file that contains either all the report variables requested (up to limit of 254) from the input file or specific ones specified by the user.	<filename>.csv
eplusmtr.csv	CSV "spreadsheet" ready file that contains either all the report meter requests (up to 254) from the input file or specific ones specified by the user.	<filename>Meter.csv

Now, each file will be described in more detail with some examples of use.

Audit.out

This file is simply the echo of the inputs to the EnergyPlus program – the Energy+.idd (data dictionary) and in.idf (<filename>.idf – the input data file). Every attempt has been made to not require this file to be saved – errors are interpreted as much as possible and encapsulated onto the eplusout.err file. Any errors in the data dictionary processing should be accomplished during development – users should never see errors there. Thus, this file is not "saved" after processing by the standard script file. Occasionally, you may wish to view this file because of something obscure.

An excerpt of the file follows. Lines in green are notes produced from EnergyPlus. Lines in red are lines with error messages shown to illustrate context. The other lines are echoes from inputs (with line numbers).

```

Getting object=LIGHTS

```

eplusout.bnd

The “branch node details” (bnd) file is intended to give enough information that one could (with a chosen software) diagram the nodes and components of the HVAC system. In addition, this will have details to support any “node connection” errors that will be noted in the eplusout.err file. Branch validation is shown in this file. Branches are checked to assure that each output node of the branch element is an input node to the next branch element. Cross-branch checking is not done directly within the program though the details will illustrate some problems of that nature.

As is standard with many EnergyPlus output files, this file is CSV (comma-delimited) such that it can be read by spreadsheet programs for further manipulation by the user.

An example will illustrate. Notes about the reporting are highlighted in green.

```

eplusout.cif

At the beginning of the simulation EnergyPlus generates an internal COMIS input file, **eplusout.cif**, based on the COMIS-related inputs described above. To retain this file, add the following line to your idf file:

```
Report, COMISinput;
```

eplusout.cif can be used as a summary and verification of your COMIS/EnergyPlus inputs. It can also be used as input to the original COMIS program for testing and debugging purposes. If EP-Launch is used or the batch files are used to run the EnergyPlus simulation, then this file will be saved as **<filename>.cif**.

An example of this file is shown in Figure 1. This is followed by a description of the contents of the file.

Figure 1. Sample COMIS input file, eplusout.cif, produced by COMIS/EnergyPlus.

The above sample differs from the actual file in that reference line numbers have been added and blank space in some of the lines has been removed to avoid line wrapping. The contents of the file are described in the succeeding section.

Description of Contents of Sample COMIS Input File

An example COMIS input file is shown in Figure 1. The following describes the contents of the lines in this file. When the contents are associated with a COMIS input object the name of the object is given in boldface; this is followed by the names of one or more input fields associated with that object. For example, Line 4 of the sample file contains the value of the “Ventilation Simulation Control” field of the COMIS Simulation object.

Line 4: **COMIS Simulation:** Ventilation Simulation Control.

Line 5: **COMIS Simulation:** Pollution Simulation Control.

Line 6: **COMIS Simulation:** Concentration Simulation Control.

Line 13-14: **COMIS Simulation**

Line 13: Under-Relaxation Factor, Absolute Flow Tolerance (kg/s), Relative Flow Tolerance, Error Estimate for Total Flow per Zone (kg/s), Start Number of Iterations, Limit for Laminar Flow Approximation (Pa).

Line 14: Flag for Using Old Pressures (1 = use pressures from previous time step at start of iterations in current time step), Flag for Pressure Initiation (0 = do linearized solution at beginning of iterations), Maximum Number of Iterations.

Lines 16-18 and 19-21: **COMIS Air Flow:Crack**: Name, Air Mass Flow Coefficient (kg/s @ 1.0 Pa), Air Mass Flow Exponent, Crack Length (m), Pollutant #1, #2 and #3 Filter Efficiencies.

Lines 23-27: **COMIS Air Flow:Opening**: input data for WIOPEN1.

Line 23: Name. Note that program has added prefix "WI" and suffix "_1". If two or more COMIS Surface Data's refer to the same COMIS Air Flow:Opening then multiple air-flow opening blocks will be created, with suffices "_1", "_2", etc.

Line 24: Air Mass Flow Coefficient When Window or Door is Closed (kg/s @ 1.0 Pa per m of crack); Air Mass Flow Exponent When Window or Door is Closed; Type of Large Vertical Opening (LVO); width of window/door (m); height of window/door (m); Extra Crack length for LVO Type 1 with Multiple Openable Parts, or Height of Pivoting Axis for LVO type 2.

Line 25: Opening Factor #1, Discharge Coefficient for Opening Factor #1, Width Factor for Opening Factor #1, Height Factor for Opening Factor #1, Start Height Factor for Opening Factor #1.

Line 26: Opening Factor #2, ...

Line 27: Opening Factor #3, ... (note: data for only two opening factors has been specified)

Lines 28-32: **COMIS Air Flow:Opening**: input data for WIOPEN2.

Lines 33-37: **COMIS Air Flow:Opening**: input data for DROPEN.

Lines 39-41: **COMIS Zone Data**: COMIS zone name in the form zN, where N = zone number of associated thermal zone; Name of Associated Thermal Zone; starting zone air temperature (C); calculated reference height (m); volume (m³); starting value of zone air humidity ratio.

Lines 43-46: **COMIS External Node**: external node number in the form exN, façade element number in the form facN, Outside Pollutant Concentration Factor (not used).

Lines 48-60: **COMIS Surface Data**--information for the air flow links, where a link can be a crack or window/door opening. Each line gives:

- Name of the heat transfer surface associated with the link.
- Name of the COMIS Air Flow:Crack or COMIS Air Flow:Opening corresponding to the link. Opening names start with WI. Other names are crack names.
- COMIS name of the link's FromZone. In COMIS, air flows across a link between two zones, one of which is the "FromZone" and the other is the "ToZone." A name of the form -exN means external air node N. See "FromZone's and ToZone's," below.
- COMIS name of the link's ToZone. A name of the form -exN means external air node N. In COMIS, air flows across a link between two zones, one of which is the "FromZone" and the other is the "ToZone." A name of the form -exN means external node N. See "FromZone's and ToZone's," below.
- Vertical distance between link and FromZone's reference plane (m)
- Vertical distance between link and ToZone's reference plane (m)

- For a window/door opening, the cosine of the angle between the plane of the opening and the vertical plane (same as sine of the window/door tilt angle).

Lines 62: **COMIS Simulation**: Reference Height for Recorded Wind Data (m)

Lines 65-69: **COMIS CP Values**

Line 65: Wind directions (degrees from North)

Lines 66-69: Façade element number in the form facN, Cp values for corresponding wind directions.

Line 71: Building parameters: height above sea level (m), azimuth (deg), latitude (deg), longitude (deg).

Lines 73-75: Wind and meteorological parameters

Line 73: Reference height for wind speed measurement (m), altitude of meteorological station (m), exponent in the power-law function of the wind velocity profile.

Lines 74-75: **COMIS Site Wind Conditions**: Wind direction (deg from North), Plan Area Density, Exponent of Wind Velocity Profile, Surrounding Building Height (m).

Line 78: Weather data for first time step: Year/month/day/hour/minutes of first time step, wind speed (m/s), wind direction (deg from North), outside drybulb temperature (C), outside humidity ratio (g/kg), barometric pressure (kPa).

Line 80: **COMIS Standard Conditions for Crack Data**: Standard Temperature for Crack Data (C), Standard Barometric Pressure for Crack Data (kPa), Standard Humidity Ratio for Crack Data (g/kg).

eplusout.dbg

This file is used by developers during debugging and can be “turned on” by the DEBUG OUTPUT object in the input file. The only reason a user might specify this flag would be to send a file to the support group.

eplusout.dxf

The DXF output report file is formatted according to the “Data Exchange Format” standard rules for representing CADD type coordinates. The file can be used in several inexpensive, shareware or freeware viewers. Quickview Plus™ can display DXF files as shown in Figure 2 below. A free program from Autocad™, Voloview Express™, can display solid model rendering as shown in Figure 3. Other viewers are available from Microstation™, Visio™ and other shareware or freeware vendors. Voloview Express is downloadable from www.autocad.com.

This file is generated when the following line is included in the IDF.

Report, Surfaces, DXF;

In addition to the building shape (including detach shading elements), the DXF view includes a “true north” arrow and the name from the BUILDING object.

Figure 2. Quick View Plus version of DXF file

Even in the Quick View version, you can see that the different building elements have different colors. Most viewers display roofs as yellow, floors as black, walls as blue, windows as green, shading (attached) as pink, and detached shades as deeper blue. This is shown more definitively in a view from Voloview Express.

Figure 3. Voloview 3D Solid view

The DXF file of itself is an ASCII file, with a specific structure as specified in the standard. An excerpt of the file is shown below:

eplusout.eio

This file contains some standard and some optional “reports”. It is intended to be a somewhat intelligent report of input conditions when they don’t fit well in other places or when they aren’t substantial enough for their own “file”. (e.g. **eplusout.bnd**) Contents of the file are somewhat documented in various places in the [Input Output Reference document](#) – as results of objects. This file or portions of it can be easily imported into spreadsheet programs and more analysis done there. Contents of this file include construction details, location information, “environment” information, number of “warmup” days required in each environment.

The form of the file is a data dictionary followed by the data. In this case, the data dictionary line precedes the first “data” line though there may be several defining “dictionary lines”. Each dictionary line will show the field as <field name> followed by other fields that will be in the data lines. Data will be displayed similarly. Each field of dictionary or data will be separated from the next by a comma “,” – and produce a comma delimited file.

Note that the lines in the eplusout.eio file can be extremely long (current limit is 500 characters).

Simulation Parameters

```
! <Version>, Version ID
Version, 1.0.3
! <Time Steps per Hour>, #TimeSteps, Minutes per TimeStep
TimeSteps Per Hour, 4, 15
! <Run Control>, Do Zone Sizing, Do System Sizing, Do Plant Sizing, Do Design Days, Do Weather Simulation
Run Control, Yes, Yes, Yes, No, Yes
! <Building Information>, Building Name, North Axis {deg}, Terrain, Loads Convergence Tolerance Value,
Temperature Convergence Tolerance Value, Solar Distribution
Building, BUILDING, 30.000, City, 0.04000, 0.40000, FullExterior
! Inside Convection Algorithm, Value {Simple | Detailed | CeilingDiffuser | TrombeWall}
Inside Convection Algorithm, Simple
! Outside Convection Algorithm, Value {Simple | Detailed}
Outside Convection Algorithm, Simple
! Solution Algorithm, Value {CTF | EMPD | MTF}
Solution Algorithm, CTF
! Sky Radiance Distribution, Value {0=Isotropic | 1=Anisotropic}
Sky Radiance Distribution, 1
! Shadowing/Sun Position Calculations [Annual Simulations], Value {days}
Shadowing/Sun Position Calculations, 20
! <AirFlow Model>, Simple/Comis
AirFlow Model, Simple
! Zone Volume Capacitance Multiplier, Value
Zone Volume Capacitance Multiplier, 1.000
! < Input Surface Geometry Information>, Starting Corner, Vertex Input Direction, Coordinate System
SurfaceGeometry, UpperLeftCorner, CounterClockwise, RelativeCoordinateSystem
```

The simulation parameters output is the simplest form of reporting in the **eplusout.eio** file. Each of the “header” records (lines starting with an “!”) are followed immediately by the one and only data line. By and large, these data lines are all merely echoes of the entries in the IDF (or defaulted for blank fields). For most of these descriptions, you can look at the object fields (of same name) in the [Input Output Reference](#) document.

Version

```
! <Version>, Version ID
Version, 1.0.3
```

This is the version of the IDF as entered in the IDF file. If it does not match the current EnergyPlus Version, a warning will be issued and show in the **eplusout.err** file.

Time Steps Per Hour

```
! <Time Steps per Hour>, #TimeSteps, Minutes per TimeStep
TimeSteps Per Hour, 4, 15
```

This is the number of time steps in hour as entered in the IDF file as well as showing how many minutes will encompass each time step (i.e. 4 time steps in hour = 15 minutes per time step).

Run Control

```
! <Run Control>, Do Zone Sizing, Do System Sizing, Do Plant Sizing, Do Design Days, Do Weather Simulation
Run Control, Yes, Yes, Yes, No, Yes
```

This shows how the sizing and running (design days vs. weather file) will be accomplished. Design days are required for sizing but do not necessarily need to be “run” after sizing has completed. Thus, the user can choose to do sizing, not do a “normal” calculation with the design day definitions but then go ahead and run the full simulation year.

Building

```
! <Building Information>, Building Name, North Axis {deg}, Terrain, Loads Convergence Tolerance Value,
Temperature Convergence Tolerance Value, Solar Distribution
Building, BUILDING, 30.000, City, 0.04000, 0.40000, FullExterior
```

This shows the values put in for the Building Object in the IDF.

Inside Convection Algorithm

```
! Inside Convection Algorithm, Value {Simple | Detailed | CeilingDiffuser | TrombeWall}
Inside Convection Algorithm, Simple
```

This shows the inside (interior) convection algorithm selected by the IDF value.

Outside Convection Algorithm

```
! Outside Convection Algorithm, Value {Simple | Detailed}
Outside Convection Algorithm, Simple
```

This shows the outside (exterior) convection algorithm selected by the IDF value.

Solution Algorithm

```
! Solution Algorithm, Value {CTF | EMPD | MTF}
Solution Algorithm, CTF
```

This shows the solution algorithm approach selected by the IDF value.

Sky Radiance Distribution

```
! Sky Radiance Distribution, Value {0=Isotropic | 1=Anisotropic}
Sky Radiance Distribution, 1
```

This shows the solution algorithm approach selected by the IDF value.

Shadowing/Sun Position Calculations

```
! Shadowing/Sun Position Calculations [Annual Simulations], Value {days}
Shadowing/Sun Position Calculations, 20
```

This shows how many days between the re-calculation of solar position during a weather file simulation. While a smaller number of days will lead to a more accurate solar position estimation (solar position is important in shadowing as well as determining how much solar enters the space), it also increases the calculation time necessarily to complete the simulation. The default, re-calculating every 20 days, give a good compromise.

AirFlow Model

```
! <AirFlow Model>, Simple/Comis
AirFlow Model, Simple
```

This shows the air flow method to be used. Note that simply selecting the COMIS model also needs to have the appropriate COMIS input statements to effect the solution. Likewise, just having the COMIS input statements does not automatically trigger this air flow model. solution algorithm approach selected by the IDF value. In this case, a warning message about “orphan objects” (the COMIS input statements) will appear in the **eplusout.err** file.

Zone Volume Capacitance Multiplier

```
! Zone Volume Capacitance Multiplier, Value
Zone Volume Capacitance Multiplier, 1.000
```

This shows the zone volume capacitance multiplier selected by the IDF value.

Surface Geometry

```
! < Input Surface Geometry Information>, Starting Corner, Vertex Input Direction, Coordinate System
SurfaceGeometry, UpperLeftCorner, CounterClockwise, RelativeCoordinateSystem
```

This shows the expected order of the vertices for each surface.

Climate Group Outputs

Climate related variables appear in two places for EnergyPlus outputs. When the simple (monthly) GroundTemperature input is done and for all location data, lines appear in the eplusout.eio file:

```
! <Location>, Location Name, Latitude, Longitude, Time Zone Number, Elevation {m}
Location, DENVER COLORADO, 39.75, -104.87, -7.00, 1610.26
! <GroundTemperatures>, Months From Jan to Dec {Deg C}
GroundTemperatures, 12.22, 12.78, 14.44, 16.67, 19.44, 23.33, 22.22, 20.00, 17.78, 16.67,
14.44, 12.78
! <GroundReflectances>, Months From Jan to Dec {dimensionless}
GroundReflectances, 0.60, 0.60, 0.40, 0.30, 0.20, 0.20, 0.20, 0.20, 0.20, 0.20, 0.40
! <Snow Ground Reflectance Modifiers>, Normal, Daylighting {dimensionless}
Snow Ground Reflectance Modifiers, 1.000, 1.000
! <Snow GroundReflectances>, Months From Jan to Dec {dimensionless}
Snow GroundReflectances, 0.60, 0.60, 0.40, 0.30, 0.20, 0.20, 0.20, 0.20, 0.20, 0.20, 0.20,
0.40
! <Snow GroundReflectances For Daylighting>, Months From Jan to Dec {dimensionless}
Snow GroundReflectances For Daylighting, 0.60, 0.60, 0.40, 0.30, 0.20, 0.20, 0.20, 0.20, 0.20,
0.20, 0.20, 0.40
```

In addition for each “environment” simulated, information about the environment is shown:

```
! <Environment>,Environment Name,Environment Type, Start Date, End Date, Start DayOfWeek, Duration
{#days}, Source:Start DayOfWeek, Use Daylight Savings, Use Holidays, Apply Weekend Holiday Rule
! <Environment:Special Days>, Special Day Name, Special Day Type, Source, Start Date, Duration {#days}
! <Environment:Daylight Saving>, Daylight Saving Indicator, Source, Start Date, End Date
! <Environment:Design Day Misc>,DayOfYear,ASHRAE A Coeff,ASHRAE B Coeff,ASHRAE C Coeff,Solar Constant-
Annual Variation,Eq of Time {minutes}, Solar Declination Angle {deg}
! <Environment:WarmupDays>, NumberofWarmupDays
```

For example, a DesignDay:

```
Environment,PHOENIX ARIZONA WINTER,DesignDay, 1/21, 1/21,MONDAY, 1,N/A,N/A,N/A,N/A
Environment:Daylight Saving,No,DesignDay
Environment:Design_Day_Misc, 21,1228.9,0.1414,5.7310E-002,1.0,-11.14,-20.0
```

Or a RunPeriod:

```
Environment,CHICAGO IL TMY2-94846 WMO#=725300,WeatherRunPeriod, 1/
1,12/31,SUNDAY,365,UseWeatherFile,Yes,Yes,No
Environment:Daylight Saving,No,
Environment:Special Days,NEW YEARS DAY,Holiday,WeatherFile, 1/ 1, 1
Environment:Special Days,MEMORIAL DAY,Holiday,WeatherFile, 5/31, 1
Environment:Special Days,INDEPENDENCE DAY,Holiday,WeatherFile, 7/ 5, 1
Environment:Special Days,LABOR DAY,Holiday,WeatherFile, 9/ 6, 1
Environment:Special Days,THANKSGIVING,Holiday,WeatherFile,11/25, 1
Environment:Special Days,CHRISTMAS,Holiday,WeatherFile,12/25, 1
Environment:WarmupDays, 4
```

Note that in this display, using “weekend rule” and specific date holidays, the actual observed dates are shown in the output display – in the example above, Independence Day (July 4) is actually observed on July 5.

Climate Group – Simple Outputs

Some of the climate outputs are a “simple” group. The “header” line is followed immediately by the data line.

Location

This output represents the location data used for the simulation. Note that if a runperiod is used, the IDF “Location” is ignored and the location from the weather file is used instead.

Field: <Location>

This data field will contain the constant "Location".

Field: Location Name

This is the name given to the location whether from the IDF or the weather file.

Field: Latitude

This is the latitude of the site, expressed decimally. Convention uses positive (+) values for North of the Equator and negative (-) values for South of the Equator. For example, S 30° 15' is expressed as -30.25.

Field: Longitude

This is the longitude of the site, expressed decimally. Convention uses positive (+) values for East of the Greenwich meridian and negative (-) values for West of the Greenwich meridian. For example, E 130° 45' is expressed as +130.75.

Field: Time Zone Number

This is the time zone of the site, expressed decimally. Convention uses positive (+) values for GMT+ (Longitude East of the Greenwich meridian) and negative (-) values for GMT- (Longitude West of the Greenwich meridian). For example, the time zone for Central US time is -6. The time zone for parts of Newfoundland is -3.5 (-3 hours, 30 minutes from GMT).

Field: Elevation {m}

This is the elevation of the site. Units are m.

Ground Temperatures**Field: <GroundTemperatures>**

This data field will contain the constant "GroundTemperatures".

Field Set (1-12) – Monthly Ground Temperatures

There will be a set of 12 numbers – the ground temperatures by month: January, February, March, April, May, June, July, August, September, October, November, December. Units are C.

Ground Reflectance**Field: <GroundReflectances>**

This data field will contain the constant "GroundReflectances".

Field Set (1-12) – Monthly Ground Reflectances

There will be a set of 12 numbers – the ground reflectances by month: January, February, March, April, May, June, July, August, September, October, November, December.

Snow Ground Reflectance Modifiers

It is generally accepted that snow resident on the ground increases the basic ground reflectance. EnergyPlus allows the user control over the snow ground reflectance for both "normal ground reflected solar" calculations (see above) and snow ground reflected solar modified for daylighting. This is the display of the user entered or defaulted values.

Field: <Snow Ground Reflectance Modifiers>

This data field will contain the constant “Snow Ground Reflectance Modifiers”.

Field: Normal

This field is the value between 0.0 and 1.0 which is used to modified the basic monthly ground reflectance when snow is on the ground (from design day input or weather data values).

$$\text{GroundReflectance}_{\text{used}} = \text{GroundReflectance} \bullet \text{Modifier}_{\text{Snow}}$$

Field: Daylighting

This field is the value between 0.0 and 1.0 which is used to modified the basic monthly ground reflectance when snow is on the ground (from design day input or weather data values).

$$\text{DaylightingGroundReflectance}_{\text{used}} = \text{GroundReflectance} \bullet \text{Modifier}_{\text{Snow}}$$

Snow Ground Reflectance

This data is the result of using the Snow Ground Reflectance modifier and the basic Ground Reflectance value.

Field: <GroundReflectances>

This data field will contain the constant “Snow GroundReflectances”.

Field Set (1-12) – Monthly Snow Ground Reflectances

There will be a set of 12 numbers – the snow ground reflectances by month: January, February, March, April, May, June, July, August, September, October, November, December.

Snow Ground Reflectance for Daylighting

This data is the result of using the Snow Ground Reflectance for Daylighting modifier and the basic Ground Reflectance value.

Field: < Snow GroundReflectances For Daylighting>

This data field will contain the constant “Snow GroundReflectances For Daylighting”.

Field Set (1-12) – Monthly Snow Ground Reflectances for Daylighting

There will be a set of 12 numbers – the ground reflectances by month: January, February, March, April, May, June, July, August, September, October, November, December.

Climate Group – Not so Simple Outputs

For each “environment” simulated, a set of outputs is produced. The header group is only produced once. (The Design Day Misc header is produced only when there is a design day.)

```
! <Environment>,Environment Name,Environment Type, Start Date, End Date, Start DayOfWeek, Duration
{#days}, Source:Start DayOfWeek, Use Daylight Saving, Use Holidays, Apply Weekend Holiday Rule
! <Environment:Special Days>, Special Day Name, Special Day Type, Source, Start Date, Duration {#days}
! <Environment:Daylight Saving>, Daylight Saving Indicator, Source, Start Date, End Date
! <Environment:Design_Day_Misc>,DayOfYear,ASHRAE A Coeff,ASHRAE B Coeff,ASHRAE C Coeff,Solar Constant-
Annual Variation,Eq of Time {minutes}, Solar Declination Angle {deg}
! <Environment:WarmupDays>, NumberofWarmupDays
```

Environment Line

Each “environment” (i.e. each design day, each run period) will have this line shown.

Field: <Environment>

This field will have the constant “Environment” in each data line.

Field:Environment Name

This field will have the “name” of the environment. For example, the design day name (“DENVER COLORADO SUMMER”) or the weather file location name (“BOULDER CO TMY2-94018 WMO#=724699”).

Field:Environment Type

This will be “DesignDay” for design day simulations and “WeatherRunPeriod” for weather file run periods.

Field: Start Date

This will have the month/day that is the starting date for the simulation period. (7/21, for example).

Field: End Date

This will have the month/day that is the ending date for the simulation period. Note that Design Days are only one day and the end date will be the same as the start date.

Field: Start DayOfWeek

For weather periods, this will be the designated starting day of week. For design days, it will be the day type listed for the design day object (e.g. SummerDesignDay or Monday).

Field: Duration {#days}

Number of days in the simulation period will be displayed in this field. Design days are only 1 day.

Field: Source:Start DayOfWeek

This field will list the “source” of the Start Day of Week listed earlier. This could be the RunPeriod command from the input file or the Weather File if the UseWeatherFile option was chosen in the RunPeriod command. For design days, this will be “N/A”.

Field: Use Daylight Saving

This field reflects the value of the Use Daylight Saving field of the RunPeriod object. For design days, this will be “N/A”.

Field: Use Holidays

This field reflects the value of the Use Holidays field of the RunPeriod object. For design days, this will be "N/A".

Field: Apply Weekend Holiday Rule

For design days, this will show "N/A". For weather periods, this will show "Yes" if the Apply Weekend Holiday Rule is in effect or "No" if it isn't.

Design Day Misc Line

This line is shown for each design day simulated. It is not shown for sizing runs that do not subsequently use the design day as a simulation period.

Field: <Design Day Misc>

This is a constant that will display "Environment:Design_Day_Misc".

Field:DayOfYear

This is the Julian day of year for the design day (i.e. Jan 1 is 1, Jan 31 is 31).

Field:ASHRAE A Coeff

Reference ASHRAE HOF 30 – this is the A Coefficient in Wh/m² calculated from EnergyPlus.

Field:ASHRAE B Coeff

Likewise, this is the ASHRAE B Coefficient (dimensionless).

Field:ASHRAE C Coeff

This is the ASHRAE C Coefficient (dimensionless).

Field:Solar Constant-Annual Variation

This is the calculated solar constant using the given location and day of year.

Field:Eq of Time {minutes}

This is the calculated equation of time (minutes) using the given location and day of year.

Field: Solar Declination Angle {deg}

This is the solar declination angle for the day of year, degrees.

Special Day Line**Field: <Environment:Special Days>**

This is a constant that will display "Environment:SpecialDays".

Field: Special Day Name

This is the user designated name for the special day.

Field: Special Day Type

This shows the type for the special day (e.g. Holiday).

Field: Source

This will display "InputFile" if it was specified in the IDF or "WeatherFile" if it came from the weather file designation.

Field: Start Date

This shows the starting date as month/day (e.g. 7/4).

Field: Duration {#days}

This shows how many days the special day period continues. Usually, holidays are only 1 day duration.

Daylight Saving Line**Field: <Environment:Daylight Saving>**

This is a constant that will display "Environment:DaylightSaving".

Field: Daylight Saving Indicator

This will be Yes if daylight saving is to be observed for this simulation period and No if it is not observed.

Field: Source

This will show the source of this invocation (or non-invocation). Inputfile if DaylightSavingPeriod was entered (weather files only), WeatherFile if used in the Weather file and selected in the Run Period object and designday if that was the source.

Field: Start Date

If the indicator field is Yes, then this field will be displayed and the month/day (e.g. 4/1) that starts the daylight saving period observance will be shown.

Field: End Date

If the indicator field is Yes, then this field will be displayed and the month/day (e.g. 10/29) that ends the daylight saving period observance will be shown.

Warmup Days Line

As described elsewhere, EnergyPlus simulates the first day of each simulation period until it reaches "convergence". This data line will show how many warm up days were required to reach that state.

Field: <Environment:WarmupDays>

This is a constant that will display "Environment:WarmupDays".

Field: NumberofWarmupDays

This field will show the number of days required to reach the convergence state for the simulation.

Zone Outputs

Each zone is summarized in a simple set of statements as shown below:

```
! <Zone Information>,Zone Name, North Axis {deg}, X Origin {m}, Y Origin {m}, Z Origin {m}, Type, Multiplier,
Ceiling Height {m}, Volume {m3}, Zone Inside Convection Algorithm {Simple-Detailed-CeilingDiffuser-
TrombeWall}, Floor Area {m2}, Exterior Gross Wall Area {m2}, Exterior Net Wall Area {m2}, Exterior Window
Area {m2}
Zone, PSI FOYER, 0.000, 0.000, 0.000, 0.000, 1, 1, 4.953, 478.555, Detailed, 96.619,
70.606, 70.606, 106.838
Zone, DORM ROOMS AND COMMON AREAS, 0.000, 0.000, 6.096, 0.000, 1, 1, 6.096,
2718.417, Detailed, 445.935, 312.154, 267.561, 44.593
Zone, LEFT FORK, -36.870, 0.000, 31.699, 0.000, 1, 1, 6.096, 453.070, Detailed, 74.322,
185.806, 135.638, 50.168
Zone, MIDDLE FORK, 0.000, 4.877, 35.357, 0.000, 1, 1, 6.096, 453.070, Detailed, 74.322,
185.806, 155.705, 30.101
Zone, RIGHT FORK, 36.870, 10.973, 35.357, 0.000, 1, 1, 6.096, 453.070, Detailed, 74.322,
185.806, 135.638, 50.168
```

Field: <Zone Information>

This field contains the constant “Zone” for each line.

Field: Zone Name

This is the Zone Name entered from the IDF.

Field: North Axis {deg}

This is the North Axis entered from the IDF. Note that this is used primarily in the positioning of the building when “relative” coordinates are used – however, the Daylighting:Detailed object also uses this. Units are degrees, clockwise from North.

Fields: X Origin {m}, Y Origin {m}, Z Origin {m}

This is the origin vertex {X,Y,Z} entered from the IDF. Note that this is used primarily in the positioning of the building when “relative” coordinates are used – however, the Daylighting:Detailed object also uses this. Units are m.

Field: TypeField: Multiplier

This is the multiplier (must be integral) entered from the IDF.

Field: Ceiling Height {m}

This is the ceiling height entered, if any, in the IDF. Ceiling height is also heuristically calculated from the surfaces in the zone – however, not all surfaces need to be entered and sometimes the user would rather enter the ceiling height for the zone. If no ceiling height was entered (i.e. the default of 0), this field will be the calculated value. A minor warning message will be issued if the calculated value is significantly different than the entered value. Units are m.

Field: Volume {m3}

Like the ceiling height, this user can also enter this value in the IDF. Volume is also heuristically calculated using the ceiling height (entered or calculated) as well as the calculated floor area (see later field). If entered here, this value will be used rather than the calculated value. A minor warning message will be issued if the calculated value is significantly different than the entered value. Units are m³.

Field: Zone Inside Convection Algorithm {Simple-Detailed-CeilingDiffuser-TrombeWall}

The interior convection algorithm shown earlier (entire building) can be overridden for each zone by an entry in the individual Zone object. This field will show which method is operational for the zone.

Field: Floor Area {m2}

This field is calculated from the floor surfaces entered for the zone. Units are m².

Field: Exterior Gross Wall Area {m2}

This field is calculated from the exterior wall surfaces entered for the zone. Units are m².

Field: Exterior Net Wall Area {m2}

This field is calculated from the exterior wall surfaces entered for the zone. Any sub-surface area is subtracted from the gross area to determine the net area. Units are m².

Field: Exterior Window Area {m2}

This field is calculated from the exterior window surfaces entered for the zone. Units are m².

Surface Details Report

A good example of this is the surface details report (**Report, Surfaces, Details;**, **Report, Surfaces, Vertices;**, **Report, Surfaces, DetailsWithVertices;**). Excerpt from the file:

```

Description of the Detailed Surfaces Report(s)

The preceding excerpt includes the surface details *and* vertices. You can also obtain the report with *just* the details or *just* the vertices.

Line 1: ! <Zone/Shading Surfaces>,<Zone Name>/#Shading Surfaces,# Surfaces, Vertices are shown starting at Upper-Left-Corner => Counter-Clockwise => World Coordinates

When a line is shown with the comment character (!) in the first position, it signifies a informational “header” record for the report. In addition, “Line 1” is also a header for the subsequent “real” surface lines.

Field: <Zone/Shading Surfaces>

This field is a dual purpose field. For beginning of the Shading Surfaces, it will show "Shading_Surfaces". At each Zone, it will show "Zone_Surfaces".

Field: <Zone Name>/#Shading Surfaces

This field is a dual purpose field. It will either show the Zone Name of the subsequent surfaces or the “Number of Shading Surfaces” for the entire building.

Field: # Surfaces

This field, then, specifies the number of surfaces of the type (zone or shading) that will follow.

The example lines illustrate:

Shading_Surfaces,Number of Shading Surfaces,	10
Zone_Surfaces,HEARTLAND AREA,	35
Zone Surfaces,MAINE WING,	12

```
Line 2: ! <HeatTransfer/ShadingSurface>,<Surface Name>,<Surface Class>,<Base Surface>,<Construction>,Nominal U (w/o film coef),Area (Net),Azimuth,Tilt,~Height,Reveal,<ExtBoundCondition>,<SunExposure>,<WindExposure>,ViewFactorToGround,ViewFactorToSky,ViewFactorToGround-IR,ViewFactorToSky-IR,#Sides,{Vertex 1},,,{Vertex 2},,,{Vertex 3},,,{Vertex 4},,,{etc}
Line 3: ! <Units>,,,,,{W/m2-K},{m2},{deg},{deg},{m},{m},{m},,,,,,,,,X {m},Y {m},Z {m},X {m},Y {m},Z {m},X {m},Y {m},Z {m}
```

Field: <HeatTransfer/ShadingSurface>

For shading surfaces, this will be a constant “Shading_Surface”. For heat transfer surfaces, this will be a constant “HeatTransfer_Surface”.

Field: Surface Name

This field will contain the actual surface name as entered in the IDF.

Field: Surface Class

This field contains the surface class (e.g. Window, Door, Wall, Roof) as entered in the IDF.

Field: Base Surface

This field contains the base surface name if this surface is a sub-surface (i.e. Window, Door).

Fields in Details and Details with Vertices report.

Field: Construction

This field will contain the name of the construction used for the surface. (Will be empty for shading surfaces).

Field: Nominal U (w/o film coef)

A nominal thermal conductance for the surface is calculated for the surface. It does not include interior or exterior film coefficients as this is calculated during the simulation and is

dependent on several factors that may change during the simulation time period. Units for this field are $W/m^2 \cdot K$.

Field: Area (net)

When surfaces are entered, the gross area of the surface is calculated from the vertices (except for Internal Mass where it is entered directly). As net area is needed in the calculations, any sub-surfaces to the primary surface are subtracted from the original gross area. This field will show the final “net” area for the surface. Units for this field are m^2 .

Field: Azimuth

Using the specified vertices for the surface (and order of entry), EnergyPlus can determine the outward facing normal angle for the surface. That angle is displayed in this field. Units for this field are degrees.

Field: Tilt

Using the specified vertices for the surface (and order of entry), EnergyPlus can determine the tilt of the surface with respect to “horizontal”. That angle is displayed in this field. Units for this field are degrees.

Field: ~Width

This field (approximate width of the surface) is calculated and filled by EnergyPlus from the entered vertices. Some parts of EnergyPlus use a width and height rather than the more detailed vertex/area calculations. Units for this field are m.

Field: ~Height

This field (approximate height of the surface) is calculated and filled by EnergyPlus from the entered vertices. Some parts of EnergyPlus use a width and height rather than the more detailed vertex/area calculations. Units for this field are m.

Field: Reveal

This field is calculated for sub-surfaces with respect to their base surfaces using the entered vertices, plane of the two surfaces, and distance between the planes. Reveal may be important in shading of windows, in particular. Units for this field are m.

Field: <ExtBoundCondition>

This field shows the exterior boundary condition for the surface. If this is a surface that is “external” the values will be **ExternalEnvironment** or **Ground**. If this surface is an interzone surface, this value will be the surface name in the “other” zone. If this surface is an internal surface, this value will be the same as the surface name. If this is a special surface with “Other Side Coefficients”, the value will be **OtherSideCoefficients**.

Field: <SunExposure>

The value for this field will be **SunExposed** or **NoSun**. Internal surfaces should have NoSun exposure.

Field: <WindExposure>

The value for this field will be **WindExposed** or **NoWind**. Internal surfaces should have NoWind exposure.

Field: ViewFactorToGround

This value has been entered as part of the surface description. View factor to ground is described in the Input Output Reference document during the Surface:HeatTransfer description.

Field: ViewFactorToSky

This value is calculated by EnergyPlus based on surface tilt and shadowing surfaces.

Field: ViewFactorToGround-IR

This value is calculated by EnergyPlus based on surface tilt and shadowing surfaces. Shadowing surfaces are considered to have the same emissivity and temperature as the ground, so they are lumped together with the ground in calculating the ground IR view factor.

Field: ViewFactorToSky-IR

This value is calculated by EnergyPlus based on surface tilt and shadowing surfaces.

Field: #Sides

This value is the number of sides / vertices the surface has.

Fields in Vertices Reports**Field Set: Vertex x [X {m}, Y {m}, Z {m}]**

For each side of the surface, the vertices are shown in three separate fields (comma separated) in the EnergyPlus “standard” coordinate order (Upper Left Corner first, Counter-Clockwise, World Coordinates). Units for each vertex is m.

Calculating with Surface Details Report

It is reasonably easy to import this data into a spreadsheet and then calculate glazing area percentage based on wall facing direction:

<Zone Name>	# Surfaces			
<Surface Name>	<Surface Class>	Nominal U (w/o film coef) {W/m2-K}	Area (Net) {m2}	Azimuth {deg}
HEARTLAND AREA	35			
ZN001:WALL001	WALL	0.64	136	180
ZN001:WALL001:WIN001	WINDOW	6.12	64	180
South Window/Wall			32%	
ZN001:WALL002	WALL	0.64	155	90
ZN001:WALL002:WIN001	WINDOW	6.12	15	90
ZN001:WALL002:WIN002	WINDOW	6.12	15	90
ZN001:WALL002:WIN003	WINDOW	6.12	15	90
East Window/Wall			23%	
ZN001:WALL003	WALL	0.64	155	0
ZN001:WALL003:WIN001	WINDOW	6.12	15	0
ZN001:WALL003:WIN002	WINDOW	6.12	15	0
ZN001:WALL003:WIN003	WINDOW	6.12	15	0
North Window/Wall			23%	
ZN001:WALL004	WALL	0.64	155	270
ZN001:WALL004:WIN001	WINDOW	6.12	15	270
ZN001:WALL004:WIN002	WINDOW	6.12	15	270
ZN001:WALL004:WIN003	WINDOW	6.12	15	270
West Window/Wall			23%	

Figure 4. Surface Details with Window/Wall % calculated

Construction Element Outputs

An optional report (contained in **eplusout.eio**) gives calculated elements for the materials and constructions used in the input. One report is specific to opaque constructions (note that nominal thermal conductance is calculated).

The report is invoked by including the following in the IDF:

```
Report,Construction;
```

```

Line 1: ! <Construction>,Construction Name,#Layers,#CTFs,Time Step {hours},ThermalConductance {w/m2-
K},OuterThermalAbsorptance,InnerThermalAbsorptance,OuterSolarAbsorptance,InnerSolarAbsorptance,Roughness

Description of the Opaque Construction Report

The Opaque Construction report has 3 parts for each construction.

Part 1 is the construction name along with some derived values for the entire construction (i.e. Thermal Conductance) as well as noting other details about the surface (# CTFs, # Layers).

Part 2 shows the material layers for the construction. This is essentially just an echo of the entered properties of the materials from the IDF.

Part 3 shows the CTFs as calculated for the Construction. CTFs are described more completely in the Engineering Reference document.

Fields in Part 1 – Opaque Construction Report

Field: <Construction>

This will be filled with the constant “Construction” for each Construction line.

Field: Construction Name

This is the name of the construction as entered in the IDF.

Field: #Layers

This is the number of material layers inferred from the construction entry in the IDF. Material layers are listed “outside” to “inside” of the construction. This, of course, depends on the placement of the surface in the building – the “outside” of an internal surface is the layer that is closest to whatever the surface touches whereas the “inside” of an internal surface is the layer that shows in the surface’s “zone”. The outside of an external surface is the layer that faces the outside environment and, again, the inside is the layer that shows in the zone.

Field: #CTFs

This is the calculated number of CTFs (Conduction Transfer Functions). The conduction transfer functions are temperature and flux coefficients that characterize the thermal properties of the wall.

Field: Time Step

The "time step" in the construction line is the time step at which the CTFs are valid. Because CTFs for certain constructions might not be stable at the user specified time step (might be too "heavy" from a thermal mass standpoint), this may be different from the zone time step (specified in "TimeStep in Hour"). In all cases though, this will be greater than or equal to the zone time step. If the time step for the construction is greater than the zone time step, E+ will use interpolated histories to solve for the surface heat balances for this surface (see discussion on interpolated histories in the [Engineering Reference](#) document).

Field: Thermal Conductance

This is the nominal thermal conductance of the construction calculated without film coefficients. Units are $\text{W/m}^2\text{-K}$.

Field: Outer Thermal Absorptance

This will be the thermal absorptance of the outer material layer.

Field: Inner Thermal Absorptance

This will be the thermal absorptance of the inner material layer.

Field: Outer Solar Absorptance

This will be the solar absorptance of the outer material layer.

Field: Inner Solar Absorptance

This will be the solar absorptance of the inner material layer.

Field: Roughness

The construction takes on the roughness from the outer material layer. Roughness is used in several parts of external environment calculations.

Fields in Part 2 – Opaque Construction Report

Line 2: ! <Material>,Material Name,Thickness {m},Conductivity {w/m-K},Density {kg/m3},Specific Heat {J/kg-K},ThermalResistance {m2-K/w}
--

In this version of part 2, the full material properties are entered by the user and displayed in the report.

Field: <Material>

This will be filled with the constant "Material" for each material layer line.

Field: Material Name

This is the name of the material as entered in the IDF.

Field: Thickness

This is the entered thickness of the material. Units are m.

Field: Conductivity

For Material:Regular materials, this will be the entered conductivity in W/m-K . For Material:Regular-R materials, this will be shown as 0.0.

Field: Density

For Material:Regular materials, this will be the entered density in kg/m^3 . For Material:Regular-R materials, this will be shown as 0.0.

Field: Specific Heat

For Material:Regular materials, this will be the entered specific heat in J/kg-K . For Material:Regular-R materials, this will be shown as 0.0.

Field: Thermal Resistance

For Material:Regular-R materials, this is the entered thermal resistance in $\text{m}^2\text{-K/w}$. For Material:Regular materials, this is the calculated thermal resistance based on the other properties.

Line 3: ! <Material:Air>,Material Name,ThermalResistance {m2-K/w}

In this version of part 2, only the thermal resistance of the air layer is entered by the user and displayed in the report.

Field: <Material:Air>

This will be filled with the constant "Material:Air" for each material layer line.

Field: Material Name

This is the name of the material as entered in the IDF.

Field: Thermal Resistance

This is the entered thermal resistance in $\text{m}^2\text{-K/w}$.

Fields in Part 3 – Opaque Construction Report

Line 4: ! <CTF>,Time,Outside,Cross,Inside,Flux (except final one)

In part 3, the CTF calculations are shown. It is necessary to use the conduction transfer functions labeled "Inside" and "Cross" to calculate the heat flux at the inside surface and the conduction transfer functions labeled "Outside" and "Cross" to calculate the heat flux at the outside surface. Inside and outside coefficients will be identical for symmetric walls.

Conduction through constructions such as walls, roofs, floors, etc. is generally characterized as one-dimensional and transient within EnergyPlus. The solution to this partial differential equation results in "conduction transfer functions" or CTFs. In a CTF equation, the current heat transfer flux due to conduction through a construction is a function of the current temperature at either face of the surface as well as the history of temperatures at either face and the history of conductive fluxes at this face. CTFs are a simplification of response factors which are based solely on temperature histories and require an "infinite" history. The inclusion of heat flux history terms reduces the overall number of terms in the equation for conductive flux significantly, resulting in a more efficient solution.

For each unique combination of materials, there are a unique set of CTFs. While there are other procedures to determine the CTFs for a particular construction, EnergyPlus uses a state-space method (see conduction transfer function documentation) to obtain the CTF coefficients. These coefficients are calculated once at the beginning of the simulation and are constant for a particular construction. The CTF equation itself is a linear equation with these constant coefficients.

Conduction heat transfer flux at the outside face of a particular surface is a function of the construction of the surface (which leads to the CTF coefficients), the current and previous temperatures at both the inside and outside face of the surface, and the previous conduction

heat transfer fluxes at the outside surface. The CTF coefficients that would be used in this equation would be the "Outside" (multiplied by the temperature history at the outside face) terms, the "Cross" (multiplied by the temperature history at the inside face) terms, and the "Flux" (multiplied by the flux history at the outside face) terms. Solving for the conductive flux at the inside surface would require the use of the "Inside" (multiplied by the temperature history at the inside face) terms, the "Cross" (multiplied by the temperature history at the outside face) terms, and the "Flux" (multiplied by the flux history at the inside face) terms. A textual example is given below for illustration purposes:

Current Outside Conductive Flux = (Outside Term 0) * (Current Outside Face Temperature)
 +(Outside Term 1) * (Previous Outside Face Temperature)
 +(Outside Term 2) * (Outside Face Temperature 2 Time Steps Ago)
 +(Outside Term 3) * (Outside Face Temperature 3 Time Steps Ago)
 + ...
 +(Cross Term 0) * (Current Inside Face Temperature)
 +(Cross Term 1) * (Previous Inside Face Temperature)
 +(Cross Term 2) * (Inside Face Temperature 2 Time Steps Ago)
 +(Cross Term 3) * (Inside Face Temperature 3 Time Steps Ago)
 + ...
 +(Flux Term 1) * (Previous Outside Face Flux)
 +(Flux Term 2) * (Outside Face Flux 2 Time Steps Ago)
 +(Flux Term 3) * (Outside Face Flux 3 Time Steps Ago)
 + ...

The number of terms is based on the CTF coefficient calculation routine and is related to the amount of thermal mass contained within a particular construction. Actual signs (positive or negative) of various terms in the preceding equation will vary based on their definition and use within the equation. Those interested in more details on the use and calculation of CTFs are encouraged to use the following Ph.D. dissertation resources: Hittle (1981, UIUC), Seem (1986, UW-Madison), Liesen (1995, UIUC), Strand (1995, UIUC).

Field: <CTF>

This will be filled with the constant "CTF" for each CTF coefficient line.

Field: Time

This field "time" refers to the history term to which the coefficients are applied. The last line is the "zero" term that gets applied to the current values of temperatures. The line with a "1" refers to the temperatures and fluxes from the previous time step--previous as in time minus one time step. Time step, in this case, is defined by the construction time step (see description on "Fields in Part 1 – Opaque Construction Report") *not* the zone time step. Lines with other values are for previous time steps at t-n(timestep). These are the terms that are used to model conduction through a construction.

Field: Outside

Field: Cross

Field: Inside

Field: Flux (except final one)

Description of the Windows Construction Report

A separate report is available for windows (note that both nominal conductance and Solar Heat Gain Coefficient are calculated for windows). Like the opaque construction, the window construction report has multiple parts – in this case, 2.

Field: <WindowConstruction>

This will be filled with the constant “Construction” for each Window Construction line.

Field: Construction Name

This is the name of the window as entered in the IDF.

Field: #Layers

This is the number of material layers inferred from the windows construction entry in the IDF. Material layers are listed “outside” to “inside” of the construction. This, of course, depends on the placement of the surface in the building – the “outside” of an internal surface is the layer that is closest to whatever the surface touches whereas the “inside” of an internal surface is the layer that shows in the surface’s “zone”. The outside of an external surface is the layer that faces the outside environment and, again, the inside is the layer that shows in the zone.

Field: Roughness

The window construction takes on the roughness from the outer material layer. Roughness is used in several parts of external environment calculations.

Field: Conductance

This is the center-of-glass conductance of the construction calculated without film coefficients, for ASHRAE winter conditions (inside air temperature = 21.1C (70F), outside air temperature = -17.8C (0F), windspeed = 6.71 m/s (15 mph), no solar radiation). Units are W/m²-K.

Field: SHGC

This is the center-of-glass Solar Heat Gain Coefficient for ASHRAE summer conditions (inside air temperature = 23.9C (75F), outside air temperature = 31.7C (89F), windspeed = 3.35 m/s (7.5 mph), 783 W/m² (248 Btu/h-ft²) incident beam solar radiation normal to glazing.

The following transmittance and reflectance values are for the window glazing (plus shade or blind, if present in the construction). For exterior windows, “front” means the side of the window facing the exterior environment and “back” means the side facing the zone. For interior windows, “front” means the side to window facing the zone and “back” means the side facing the adjacent zone.

Field: Solar Transmittance at Normal Incidence

Transmittance at normal incidence averaged over the solar spectrum.

Field: Visible Transmittance at Normal Incidence

Transmittance normal incidence averaged over the solar spectrum and weighted by the response of the human eye.

Field: Diffuse Solar Transmittance

Hemispherical diffuse transmittance averaged over the solar spectrum.

Field: Diffuse Visible Transmittance

Hemispherical diffuse transmittance averaged over the solar spectrum and weighted by the response of the human eye.

Field: Diffuse Front Solar Reflectance

Hemispherical diffuse reflectance--averaged over the solar spectrum—for radiation incident on the front of the window.

Field: Diffuse Back Solar Reflectance

Hemispherical diffuse reflectance--averaged over the solar spectrum—for radiation incident on the back of the window.

Field: Diffuse Front Visible Reflectance

Hemispherical diffuse reflectance--averaged over the solar spectrum and weighted by the response of the human eye—for radiation incident on the front of the window.

Field: Diffuse Back Visible Reflectance

Hemispherical diffuse reflectance--averaged over the solar spectrum and weighted by the response of the human eye—for radiation incident on the back of the window.

Fields in Part 2 – Window Construction Report

Part 2 of the Window Construction Report encompasses several “lines”.

```

Line 2: ! <Material:WindowGlass>,Material Name,Thickness {m},Conductivity {w/m-
K},SolarTransmittance,VisibleTransmittance,ThermalFrontAbsorptance,ThermalBackAbsorptance,SolarFrontReflec
tance,SolarBackReflectance,VisibleFrontReflectance,VisibleBackReflectance
Line 3: ! <Material:WindowGas>,Material Name,GasType,Thickness {m},Conductivity {w/m-K},Density
{kg/m3},Viscosity {kg/ms},Prandtl
Line 4: ! <Material:WindowShade>,Material Name,Thickness {m},Conductivity {w/m-
K},ThermalAbsorptance,Transmittance,VisibleTransmittance,ShadeReflectance
Line 5: ! <Material:WindowBlind>,Material Name,SlatWidth {m},SlatSeparation {m},SlatThickness
{m},SlatAngle {deg},SlatBeamSolarTransmittance,SlatBeamSolarFrontReflectance,BlindToGlassDistance {m}

```

Material: WindowGlass**Field: <Material:WindowGlass>**

This will be filled with the constant “Material:WindowGlass” for each material of this type in the construction.

Field: Material Name

Name of the glass layer.

Field: Thickness {m}

Thickness of the glass layer.

Field: Conductivity {w/m-K}

Conductivity of the glass layer.

Field: SolarTransmittance

Transmittance of the glass layer at normal incidence averaged over the solar spectrum.

Field: VisibleTransmittance

Transmittance normal incidence of the glass layer averaged over the solar spectrum and weighted by the response of the human eye.

Field: ThermalFrontAbsorptance

Thermal emissivity of the front face of the glass layer.

Field: ThermalBackAbsorptance

Thermal emissivity of the back face of the glass layer.

Field: SolarFrontReflectance

Reflectance of the front face of the glass layer at normal incidence averaged over the solar spectrum.

Field: SolarBackReflectance

Reflectance of the back face of the glass layer at normal incidence averaged over the solar spectrum.

Field: VisibleFrontReflectance

Reflectance of the front face of the glass layer at normal incidence averaged over the solar spectrum.

Field: VisibleBackReflectance

Reflectance of the back face of the glass layer at normal incidence averaged over the solar spectrum.

Material:WindowGas**Field: <Material:WindowGas>**

This will be filled with the constant "Material:WindowGas" for each material of this type in the construction.

Field: Material Name

Name of the gas layer.

Field: GasType

Type of the gas layer. Possibilities are Air, Argon, Krypton, Xenon, and Custom.

Field: Thickness {m}

Thickness of the gas layer.

Material:WindowShade**Field: <Material:WindowShade>**

This will be filled with the constant "Material:WindowShade" for each material of this type in the construction.

Field: Material Name

Name of the window shade layer.

Field: Thickness {m}

Thickness of the window shade layer.

Field: Conductivity {w/m-K}

Thermal conductivity of the window shade layer.

Field: ThermalAbsorptance

Emissivity of the window shade layer (assumed same for front and back faces).

Field: SolarTransmittance

Transmittance of the window shade layer averaged over the solar spectrum. Assumed same for beam solar radiation and diffuse solar radiation. Transmittance of beam solar radiation is assumed to be independent of angle of incidence.

Field: VisibleTransmittance

Transmittance of the window shade layer averaged over the solar spectrum and weighted by the response of the human eye. Assumed same for beam visible radiation and diffuse visible radiation. Transmittance of beam visible radiation is assumed to be independent of angle of incidence.

Field: ShadeReflectance

Reflectance of the window shade layer averaged over the solar spectrum. Assumed same for beam solar radiation and diffuse solar radiation. Reflectance of beam solar radiation is assumed to be independent of angle of incidence. Reflectance is assumed to be the same for the front and back faces of the shade layer.

Material:WindowBlind

This will be filled with the constant "Material:WindowBlind" for each material of this type in the construction.

Field: <Material:WindowBlind>**Field: Material Name**

Name of the blind layer.

Field: SlatWidth {m}

Width of the slats in the blind.

Field: SlatSeparation {m}

Distance between the centerline of adjacent slats.

Field: SlatThickness {m}

Distance between front and back faces of a slat.

Field: SlatAngle {deg}

This is the angle between the glazing outward normal and the slat outward normal, where the outward normal points away from the front face of the slat.

Field: SlatBeamSolarTransmittance

The beam solar transmittance of the slat at normal incidence. Any transmitted beam radiation is assumed to be 100% diffuse (i.e., slats are translucent). Transmittance is assumed to have the same value at other angles of incidence.

Field: SlatBeamSolarFrontReflectance

The beam solar reflectance at normal incidence on the front side of the slat. Assumed to have the same value at other angles of incidence (matte finish).

Field: BlindToGlassDistance {m}

Distance from the mid-plane of the blind to the adjacent glass (m).

Sizing Information

Details about sizing information and fields will be included at a later date.

eplusout.end

This is a simple one line synopsis of the simulation. Successful or Not Successful, including number of errors/warnings:

```
EnergyPlus Completed Successfully-- 8 Warning; 0 Severe Errors
```

If no file is produced, it is really *not* successful and EnergyPlus has probably crashed during the run. This file and its contents are intended for interfaces that will put friendly front-ends onto EnergyPlus. This file is also used by the EP-Launch program so that it can determine if the run was successful or not – if not, the user should review the eplusout.err file. (Actually,

the eplusout.err file should always be reviewed but often is ignored in haste to view the results.)

eplusout.err

This file is *very important* to every simulation run. All of the warnings, errors, etc that occur during the run will show up in this file. They may show up in other files as well.

Table 3. EnergyPlus Errors

Error Level	Action
Warning	Take note
Severe	Should Fix
Fatal	Program will abort

The previous table illustrates the three levels of errors that occur in the eplusout.err file. Several other message lines may be shown as well. For example:

```
** Warning ** World Coordinate System selected. Some Zone Origins are non-zero.
**   ~~~ ** These will be used in Daylighting:Detailed calculations but not in normal geometry
inputs.
```

The line that includes the “~~~” is a “continue” error line. It continues from the previous line to help describe the context of the error.

Some common errors, their consequences, and what to do about them follows:

```
** Severe ** Possible incorrect IDD File
** Severe ** Possible Invalid Numerics
** Fatal  ** Errors occurred on processing IDF file. Preceding condition(s) cause termination.
```

The previous errors cause program termination. The most likely cause is that you have an “old” IDF and have not converted it to work with the current version of the program. In this case, you will likely have some other hints such as alphas in numeric fields or too many fields in an object. Energyplus also has built in range checking:

```
** Severe ** Out of range value numeric Field#7 (Sky Clearness),
value=100.00000, range=>=0.0 and <=1.2, in DESIGNDAY=FALL
```

The error message should supply you with enough information to find the line with the error.

Error – <schedule not found>

All, or virtually all, objects that have schedules in their fields must have a schedule actually input into this field. To leave it blank will result in a severe error that will later terminate the run.

Schedule <schedule name> has missing days

Schedule periods in EnergyPlus must fill a full year.

Zone Name in <internal gain> statement not found

If a statement specifies a zone name as part of its fields, it cannot be left blank.

eplusout.eso

The standard output file from EnergyPlus. It includes all the applicable variables selected with the “Report Variable” commands as well as those with the “Report Meter” commands. All levels of frequency of reporting are included intermingled as occurs in the running of the program. The form of the file is a data dictionary, followed by the data.

In this case, the dictionary portion of the file comes first followed by an “end of data dictionary line” and then the data makes up the rest of the file.

```

486,31.5855358697037

```

Each report variable (ref: eplusout.rdd) is assigned an identification number, as in the line:

```
486,2,NORTH ZONE,Zone/Sys Air Temp[C] !Hourly
```

#486 is the id number of the Zone/Sys Air Temp value for the North Zone.

2 – is the number of parameters on the line

North Zone – the identifying “key name” for the line

Zone/Sys Air Temp [C] – the actual report variable name along with units [C]

! Hourly – the ! is the standard comment character, information following this character reminds the user how frequently this data will appear in the following.

More details on this file format can be found in the [Interface Developer's Guide](#).

eplusout.mtd

This file contains the “meter details” for the run. This shows what report variables are on which meters and vice versa – which meters contain what report variables.

An abbreviated example shows:

```

Meters for 356,EAST ZONE:Lights-Electric Consumption[J]
  OnMeter=Electricity:Facility [J]
  OnMeter=Electricity:Building [J]
  OnMeter=Electricity:Zone:EAST ZONE [J]
  OnMeter=GeneralLights:Electricity [J]
  OnMeter=GeneralLights:Electricity:Zone:EAST ZONE [J]

For Meter=Electricity:Facility [J], contents are:
  EAST ZONE:Lights-Electric Consumption[J]
  NORTH ZONE:Lights-Electric Consumption[J]
  RESISTIVE ZONE:Electric Eq-Consumption[J]
  EAST ZONE:Electric Eq-Consumption[J]
  NORTH ZONE:Electric Eq-Consumption[J]
  SUPPLY FAN 1:Fan Electric Consumption[J]
  LITTLE CHILLER:Chiller Electric Consumption [J]
  BIG CHILLER:Chiller Electric Consumption [J]
  CIRC PUMP:Pump Electric Consumption [J]
  COND CIRC PUMP:Pump Electric Consumption [J]
  HW CIRC PUMP:Pump Electric Consumption [J]
  BIG TOWER:Tower Fan Electric Consumption [J]

```

This shows the meters on which the Zone:Lights – Electric Consumption appear as well as the contents of the Electricity:Facility meter.

eplusout.mtr

This is the equivalent file to the eplusout.eso file but contains only the Report Meter requests. The format and style of the file is identical to the eplusout.eso file.

eplusout.rdd

This file (invoked by the Report,Variable Dictionary; command) shows all the report variables along with their “availability” for the current input file.

“**Zone**” variables are calculated and can be reported after each Zone/Heat Balance timestep (ref: TimeSteps in Hour command). “**HVAC**” variables are calculated and can be reported with each variable HVAC timestep. “Average” variables will be averaged over the time interval being reported whereas “sum” variables are summed over that time interval.

A typical rdd file might be:

```

eplusout.sln

The following shows an excerpt of “lines” report (**eplusout.sln**) for a single surface. It gives the coordinates in the “standard” EnergyPlus fashion (that is, UpperLeftCorner first and proceeding around, in this case, the four vertices in the surface.

0.00,	0.00,	4.57,	0.00,	0.00,	0.00

```

Or as depicted in a chart:

Figure 6. Zone Sizing from eplusout.zsz

eplusout.csv**eplusmtr.csv**

The eplusout.csv and eplusmtr.csv are files that can be produced by post-processing on the eplusout.eso and eplusout.mtr files, respectively. EnergyPlus distributes a post-processing program (ReadVarsESO – see next section) with the installation. Be warned that, though ReadVarsESO can produce the files, it may be slow – it may take as long to produce the files as running EnergyPlus itself. Future releases will hopefully show improved speed in the ReadVarsESO execution.

Example Input Files

The full EnergyPlus install includes a myriad of example input files. For the most part, the developers create these files to illustrate and test a specific feature in EnergyPlus. Then, we pass them along to you for illustrative purposes.

Following convention, each example file should have at the top a set of comments that tell what the purpose of the file is and the key features.

For example, the file titled “5ZoneAirCooled.idf” has:

```
! 5ZoneAirCooled.idf
! Basic file description: 1 story building divided into 4 exterior and
!   one interior conditioned zones and a return plenum.
! Building: single floor rectangular building 100 ft x 50 ft. 5 zones -
!           4 exterior, 1 interior, zone height 8 feet. Exterior zone
!           depth is 12 feet. There is a 2 foot high return plenum: the
!           overall building height is 10 feet. There are windows on
!           all 4 facades; the south and north facades have glass doors.
!           The south facing glass is shaded by overhangs. The walls
!           are woodshingle over plywood, R11 insulation, and gypboard.
!           The roof is a gravel built up roof with R-3 mineral board
!           insulation and plywood sheathing. The floor slab is 4 inches
!           of heavy concrete over 2 feet of dirt. The windows are double
!           pane 6mm clear with 6mm air gap. The window to wall ratio is
!           approximately 0.29.
!
!           The building is oriented 30 degrees east of north.
!
! Internal: lighting is 1.5 watts/ft2, office equip is 1.0 watts/ft2. There
!           is 1 occupant per 100 ft2 of floor area. The infiltration is
!           0.25 air changes per hour.
! HVAC:     Standard VAV system with outside air economizer, hot water reheat
!           coils, central chilled water cooling coil. Central Plant is
!           single hot water boiler, electric compression chiller with air
!           cooled condenser. All equipment is autosized.
```

In addition to the idf files, usually an .rvi and perhaps a .mvi of the same file set is included. As discussed previously, the .rvi is used with the ReadVarsESO post-processing program and the .eso file to create a .csv file which can be read easily into Excel™. Like the .rvi, the .mvi file can be used with the .mtr file to create a similar version for “metered” outputs.

Files included in V1.0.3

1ZoneUncontrolled.idf

This is almost the simplest conceivable input file – 4 walls, no roof, no floor, no HVAC. Also shown as the sample in Input Output Reference document.

3zvent.idf

This is the primary COMIS example file. Uses a weather file.

5Zone files

The files entitled “5Zonexxxx” have the same basic floor plan and then add features. Most of them illustrate autosizing.

Data Sets

Data sets are the EnergyPlus answer to “libraries”. Data sets come in two flavors – a simple list and a “macroized” list. Macroized lists are files that could have the elements extracted using a simple macro name.

Simple List Data Sets

BLASTConstructs.idf

This data set contains the “constructions” that were in the BLAST libraries (Walls, Roofs, Floors). It uses materials from the BLAST Materials data set but does not include them in this file.

BLASTDesignDays.idf

This data set contains the design days that were in the BLAST Design Days library. It references (indirectly) locations from the BLAST Locations data set.

BLASTLocations.idf

This data set contains the locations (with added elevation information) that were in the BLAST Locations library. These can be used alone or accompanying the design day information from the BLAST Design Days data set.

BLASTMaterials.idf

This data set contains the materials that were in the BLAST Materials library. These are used in the constructions shown in the BLAST Constructs data set.

BLASTSchedules.idf

This data set contains the schedule information (Day Schedules, Week Schedules) that were in the BLAST Schedules library.

CompositeWallConstructions.idf

The Reference Data Set CompositeWallConstructions.idf contains constructions and associated materials for a set of **composite** walls. These are walls—such as stud walls—that have complicated heat-flow paths so that the conduction is two- or three-dimensional.

An example entry in this data set—for an insulated 2"x4" steel-stud wall--looks like:

```

CONSTRUCTION,Composite 2x4 Steel Stud R11,
! ASHRAE 1145-RP Wall Assembly 10
! 2"x4" steel studs at 24" on center with between-stud R11 fibreglass insulation.
! Studs are 3.5", 16 gauge, 15 flange.
! Layers are 1/2" wood siding, 1/2" plywood, 2x4 steel studs and R11 insulation, 1/2" gypsum board.
! Area-average R-Value = 8.796 ft2-F-h/Btu (1.548 m2-K/W).
! Total wall thickness = 5.00in (0.127m)
! Material layer names follow:
Composite 2x4 Steel Stud R11 #1,
Composite 2x4 Steel Stud R11 #2,
Composite 2x4 Steel Stud R11 #3;
MATERIAL:REGULAR,Composite 2x4 Steel Stud R11 #1,
Smooth,    !- Roughness
0.013,    !- Thickness (m)
0.720,    !- Conductivity (W/m-K)
640.0,    !- Density (kg/m3)
1048,     !- Specific Heat (J/kg-K)
0.9,      !- Absorptance:Thermal
0.7,      !- Absorptance:Solar
0.7;      !- Absorptance:Visible
MATERIAL:REGULAR,Composite 2x4 Steel Stud R11 #2,
Smooth,    !- Roughness
0.089,    !- Thickness (m)
0.060,    !- Conductivity (W/m-K)
118.223,  !- Density (kg/m3)
1048,     !- Specific Heat (J/kg-K)
0.9,      !- Absorptance:Thermal
0.7,      !- Absorptance:Solar
0.7;      !- Absorptance:Visible
MATERIAL:REGULAR,Composite 2x4 Steel Stud R11 #3,
Smooth,    !- Roughness
0.025,    !- Thickness (m)
0.452,    !- Conductivity (W/m-K)
413.782,  !- Density (kg/m3)
1048,     !- Specific Heat (J/kg-K)
0.9,      !- Absorptance:Thermal
0.7,      !- Absorptance:Solar
0.7;      !- Absorptance:Visible

```

The materials here are **not** real materials but are “equivalent” materials obtained from finite-difference modeling.¹ EnergyPlus will calculate conduction transfer functions using these materials. The heat transfer based on these conduction transfer functions will then be very close to what would be calculated with a two- or three-dimensional heat transfer calculation.

For stud walls, using these composite constructions will give more accurate heat flow than you would get by manually dividing the wall into a stud section and a non-stud section.

If your wall's exterior or interior roughness or thermal, solar or visible absorptances are different from those in the data set, you can make the appropriate changes to the first material (the outside layer) or the third material (the inside layer). **None of the other values should be changed.**

Following is a summary of the constructions in the composite wall data set:

```

CONSTRUCTION,Composite 2x4 Wood Stud R11,
! ASHRAE 1145-RP Wall Assembly 1
! 2"x4" wood studs at 24" on center with between-stud R11 fibreglass insulation.
! Layers are 1/2" wood siding, 1/2" plywood, 2x4 wood studs and R11 insulation, 1/2" gypsum board.
! Area-average R-Value = 11.391 ft2-F-h/Btu (2.005 m2-K/W).

```

¹ The thickness, conductivity, density and specific heat values of the material layers for the different constructions have been taken from the ASHRAE report “Modeling Two- and Three-Dimensional Heat Transfer through Composite Wall and Roof Assemblies in Hourly Energy Simulation Programs (1145-TRP),” by Enermodal Engineering Limited, Oak Ridge National Laboratory, and the Polish Academy of Sciences, January 2001.

CONSTRUCTION,**Composite 2x6 Wood Stud R19,**
! ASHRAE 1145-RP Wall Assembly 2
! 2"x6" wood studs at 24" on center with between-stud R19 fiberglass insulation.
! Layers are 1/2" wood siding, 1/2" plywood, 2x6 wood studs and R19 insulation, 1/2" gypsum board.
! Area-average R-Value = 17.487 ft²-F-h/Btu (3.078 m²-K/W).

CONSTRUCTION,**Composite Insulated Concrete Form Wall With Steel Ties,**
! ASHRAE 1145-RP Wall Assembly 7
! Wall system is made of two rigid insulation sides held together with wire mesh.
! The two sides come together to create the formwork for the concrete.
! Layers are 3/4" concrete stucco, outer polystyrene shell, concrete core, inner polystyrene shell.
! Area-average R-Value = 11.230 ft²-F-h/Btu (1.977 m²-K/W).

CONSTRUCTION,**Composite Concrete/Foam/Concrete With Steel Connectors,**
! ASHRAE 1145-RP Wall Assembly 8
! Wall system is made of two 3" concrete slabs separated by 2" rigid insulation.
! The slab connectors are steel ties with a 0.15"x0.15" cross section.
! Layers are 3" concrete, 2" polystyrene, 3" concrete.
! Area-average R-Value = 7.659 ft²-F-h/Btu (1.348 m²-K/W).

CONSTRUCTION,**Composite Concrete/Foam/Concrete With Plastic Connectors,**
! ASHRAE 1145-RP Wall Assembly 9
! Wall system is made of two 3" concrete slabs separated by 2" rigid insulation.
! The slab connectors are plastic ties with a 0.25"x0.25" cross section.
! Layers are 3" concrete, 2" polystyrene, 3" concrete.
! Area-average R-Value = 10.582 ft²-F-h/Btu (1.862 m²-K/W).

CONSTRUCTION,**Composite 2x4 Steel Stud R11,**
! ASHRAE 1145-RP Wall Assembly 10
! 2"x4" steel studs at 24" on center with between-stud R11 fiberglass insulation.
! Studs are 3.5", 16 gauge, 15 flange.
! Layers are 1/2" wood siding, 1/2" plywood, 2x4 steel studs and R11 insulation, 1/2" gypsum board.
! Area-average R-Value = 8.796 ft²-F-h/Btu (1.548 m²-K/W).

CONSTRUCTION,**Composite Brick Foam 2x4 Steel Stud R11,**
! ASHRAE 1145-RP Wall Assembly 15
! Brick veneer, polystyrene, 2"x4" steel studs at 24" on center with
! between-stud R11 fiberglass insulation.
! Studs are 3.5", 16 gauge, 15 flange.
! Layers are 3.25" brick, 1" polystyrene insulation, 1/2" plywood, 2x4 steel studs and R11 insulation,
! 1/2" gypsum board.
! Area-average R-Value = 12.792 ft²-F-h/Btu (2.251 m²-K/W).

CONSTRUCTION,**Composite 2x6 Steel Stud R19,**
! ASHRAE 1145-RP Wall Assembly 16
! 2"x6" steel studs at 24" on center with between-stud R19 fiberglass insulation.
! Studs are 5.5", 16 gauge, 15 flange.
! Layers are 1/2" wood siding, 1/2" plywood, 2x6 steel studs and R19 insulation, 1/2" gypsum board.
! Area-average R-Value = 12.792 ft²-F-h/Btu (1.991 m²-K/W).

CONSTRUCTION,**Composite Foam 2x6 Steel Stud R19,**
! ASHRAE 1145-RP Wall Assembly 17
! Polystyrene, 2"x6" steel studs at 24" on center with between-stud R19 fiberglass insulation.
! Studs are 5.5", 16 gauge, 15 flange.
! Layers are 3/4" concrete stucco, 1" polystyrene insulation, 1/2" plywood, 2x6 steel studs and R19
! insulation,
! 1/2" gypsum board.
! Area-average R-Value = 15.157 ft²-F-h/Btu (2.668 m²-K/W).

CONSTRUCTION,**Composite Brick Foam 2x6 Steel Stud R19,**
! ASHRAE 1145-RP Wall Assembly 18
! Brick veneer, polystyrene, 2"x6" steel studs at 24" on center with
! between-stud R19 fiberglass insulation.
! Studs are 5.5", 16 gauge, 15 flange.
! Layers are 3.25" brick, 1" polystyrene insulation, 1/2" plywood, 2x6 steel studs and R19 insulation,
! 1/2" gypsum board.
! Area-average R-Value = 15.465 ft²-F-h/Btu (2.722 m²-K/W).

CONSTRUCTION,**Composite 2-Core Filled Concrete Block Uninsulated,**
! ASHRAE 1145-RP Wall Assembly 19
! Wall system is made of 12" 2-core concrete blocks without insulation.

```
! The core area is filled with rebar and poured concrete.
! Area-average R-Value = 1.326 ft2-F-h/Btu (0.239 m2-K/W) .

CONSTRUCTION, Composite 2-Core Filled Concrete Block Insulated,
! ASHRAE 1145-RP Wall Assembly 20
! Wall system is made of 12" 2-core concrete blocks with 1.875"-thick
! foam inserts in the block cores.
! The remaining core area is filled with poured concrete.
! Area-average R-Value = 2.291 ft2-F-h/Btu (0.403 m2-K/W) .
```

DOE-2Constructs.idf

This data set contains the “constructions” that were in the DOE-2 libraries. It uses materials from the DOE-2 Materials data set but does not include them in this file.

DOE-2Materials.idf

This data set contains the materials that were in the DOE-2 Materials library. These are used in the constructions shown in the DOE-2 Constructs data set.

FluidPropertiesRefData.idf

This data set includes fluid properties reference data. Included are

Refrigerants

R11
R12
R22
R123
R134a
NH3
Steam

Glycols

EthyleneGlycol
PropyleneGlycol
Water

MoistureMaterials.idf

This data set includes the special moisture materials that can be used with the MTF calculation procedure.

PollutionCoefficients.idf

This data set includes the pollution coefficients that can be used with reporting pollution values.

USHolidays-DST.idf

This is the set of US national holidays as well as daylight saving period defaults.

Window5DataFile.dat

This is an example data file from the Window5 program that can be used with EnergyPlus windows.

WindowBlindMaterials.idf

This is a data set of Window Blind materials.

WindowConstructs.idf

This is a data set of Window constructions. It does not include the required pieces of the Window construction (glass materials, gas materials).

WindowGasMaterials.idf

This is a data set of Window Gas materials.

WindowGlassMaterials.idf

This is a data set of Window Glass materials.

WindowShadeMaterials.idf

This is a data set of Window Shade materials.

Macro Data Sets**Locations-DesignDays.xls**

Strictly speaking, the locations-designdays.xls file is not a macro enabled input file. Rather, it is the “pointer” to other files and can be searched by city name, country, etc. The first few lines of the file (which is tab-delimited and easily readable by Excel™) illustrate how it can be used:

City	State/Province	Country	Key Name	File where located
WILLEMSTAD		NETHERLANDS ANTILLES	ANT_WILLEMSTAD	WorldDesignDayDefinitions
ABU DHABI		UNITED ARAB EMIRATES	ARE_ABU_DHABI	WorldDesignDayDefinitions
DUBAI		UNITED ARAB EMIRATES	ARE_DUBAI	WorldDesignDayDefinitions

Figure 7. Illustration for Locations-Design Days Index File

To use the file, you can sort or search on city name, state / province, country. The Key_Name column indicates the “macro name” for the location/design day group and the File where located column indicates one of the following files. You can then either view and copy the appropriate data or use the EP-Macro program to do it for you with a judicious set of input requests.

So, for example, using:

```
##defl USA_PA_PHILADELPHIA_WILLOW_GROVE_NAS
##includesilent e:\eplus\MacroDataSets\USDesignDayDefinitions.imf
```

will include in the input file, the location and design day objects for Philadelphia, PA Willow Grove Naval Air Station or:

```

Location,
  PHILADELPHIA_WILLOW_GROVE_NAS Design Conditions,      !- Location Name
  40.20000      ,      !- Latitude {N+ S-}
  -75.15000     ,      !- Longitude {W- E+}
  -5.000000    ,      !- Time Zone Relative to GMT {GMT+/-}
  110.0000     ;      !- Elevation {m}

! Using Design Conditions from "United States Climate Design Data 2001 ASHRAE Handbook"

! PHILADELPHIA WILLOW GROVE NAS Heating 99.6%, MaxDB= -12.00 Wind Speed= 2.40 Wind Dir= 300.00

```

Design day “definitions” originate in the ASHRAE Handbook of Fundamentals. Prior to 1997, these conditions were described for winter and summer (heating and cooling). They were based on seasonal percentages.

Beginning in 1997, and continuing (the latest version was published in 2001), the design condition data is based on annual percentages. In addition, only locations with long-term hourly observations data (on which to form the basis) are included. (The specifics for each location can be seen in the USDesignConditions, CanadaDesignConditions and WorldDesignConditions files that are used in the Weather Converter – see the [Auxiliary Programs](#) document). The data sets embody the conditions contained in the Weather Converter files – into a form usable by EnergyPlus for Design Day definitions.

[From ASHRAE Handbook of Fundamentals, 2001]:

- Heating conditions are often used in the sizing of heating equipment. In cold spells, dry-bulb temperatures below the design conditions can last for a week or more.
- The first cooling conditions, based on dry-bulb temperatures (i.e., DB=>MWB), often represent conditions on hot, mostly sunny days. These are useful for cooling applications, especially air-conditioning.
- Design conditions based on wet-bulb temperatures (i.e., WB=>MDB) represent extremes of the total sensible plus latent heat of outdoor air. This information is useful for cooling towers, evaporative coolers, and fresh air ventilation system design.

- Design conditions based on dew-point temperatures (i.e., $DP \Rightarrow MDB$) are directly related to extremes of humidity ratio, which represent peak moisture loads from the weather. Extreme dew-point conditions may occur on days with moderate dry-bulb temperatures resulting in relatively high humidity. These values are especially useful for applications involving humidity control, such as desiccant cooling and dehumidification, cooling-based dehumidification, and fresh air ventilation systems. These values are also used as a check point when analyzing the behavior of cooling systems at part load conditions, particularly when such systems are used for humidity control as a secondary function.

BLASTLocationsDesignDays.imf

This data set came from BLAST location and design days originally and represent pre-1997 design conditions for the locations listed. As noted above, these design conditions were based on seasonal percentages – these represent the 2.5% conditions.

CanadaDesignDayDefinitions.imf

This data set is from the Canadian design conditions represented in ASHRAE Handbook of Fundamentals, Chapter F27, Tables 2A and 2B.

USDesignDayDefinitions.imf

This data set is from the United States design conditions represented in ASHRAE Handbook of Fundamentals, Chapter F27, Tables 1A and 1B.

WorldDesignDayDefinitions.imf

This data set is from the World design conditions represented in ASHRAE Handbook of Fundamentals, Chapter F27, Tables 3A and 3B.
